Academic Year: 2026–2027

1. ABSTRACT

The Smart Tourist Safety Management System is a web-based application developed to provide tourists with easy access to safety-related services. The system provides features such as tourist registration, login, dashboard, map, SOS assistance, police information, Digital ID, and an AI-based safety feature.

The application is developed using HTML, CSS, and JavaScript. The project focuses on providing a simple and user-friendly interface where tourists can access important safety features from a single platform.

2. INTRODUCTION

Tourists may face difficulties when travelling in unfamiliar locations, especially during emergency situations. They may not know nearby police stations, emergency services, or how to quickly access safety information.

The Smart Tourist Safety Management System provides a centralized web platform for accessing important tourist safety features. It aims to make safety information and emergency-related services easier to access.

3. PROBLEM STATEMENT

Tourists may have difficulty accessing emergency assistance and safety information in unfamiliar places. A centralized digital platform can help provide important safety features in one place.

Therefore, this project is developed to provide tourists with a simple web-based safety management system.

4. OBJECTIVES

The main objectives are:

- To develop a tourist safety web application.
- To provide easy access to safety features.
- To provide tourist registration and login.
- To provide a centralized dashboard.
- To provide map-based information.
- To provide an SOS feature.
- To provide police-related information.
- To provide a Digital ID.
- To provide an AI-based safety feature.
- To develop a simple and user-friendly interface.

5. TECHNOLOGIES USED

- HTML – Used to create the structure of web pages.
- CSS – Used for styling and designing the interface.
- JavaScript – Used to provide interactive functionality and validation.
- Visual Studio Code – Used for development.
- Git – Used for version control.
- GitHub – Used to store and manage the project source code.

6. SYSTEM MODULES

6.1 Registration

Allows tourists to enter their required details and register with the system.

6.2 Login

Allows registered users to access the application.

6.3 Dashboard

Provides access to the major features of the tourist safety system.

6.4 Map

Provides map-based information to help tourists identify locations.

6.5 SOS

Provides an emergency assistance interface for tourists.

6.6 Police

Provides police and safety-related information.

6.7 Digital ID

Provides digital tourist identification information.

6.8 AI Safety

Provides an AI-based safety feature as part of the application.

7. SYSTEM WORKING

The user first opens the Smart Tourist Safety Management System through a web browser.

The user can register and log in to access the system. After login, the dashboard provides access to different safety modules.

The tourist can use the map feature for location-related information, access the SOS feature during emergencies, view police information, and use the Digital ID and AI safety features.

The application uses HTML for page structure, CSS for design, and JavaScript for interactive functionality.

8. FOLDER STRUCTURE

Smart-Tourist-Safety-System/

```
|
|— index.html
|— login.html
|— register.html
|— dashboard.html
|— map.html
|— sos.html
|— police.html
|— digitalid.html
|— ai.html
|
|— css/
|
|— js/
```

The HTML files contain the different pages, while CSS and JavaScript files are organized separately for better project management.

9. VALIDATION

Validation is used to ensure that users provide appropriate information in forms.

The application can check required fields and user input before processing the information.

This helps reduce incorrect or incomplete data entry.

10. TESTING

The application was tested by opening the different pages in a web browser and checking the major functions.

The following features were tested:

- Registration
- Login
- Dashboard navigation
- Map
- SOS
- Police information
- Digital ID
- AI feature
- Form inputs
- Page navigation

The application was checked to ensure that the required pages and functions work as expected.

11. GIT AND GITHUB

Git is used for version control of the project. It helps track changes made during development.

GitHub is used to store and manage the project source code online.

GitHub Repository:

<https://github.com/Sharmilaudhayakumar/Smart-Tourist-Safety-System>

12. FUTURE ENHANCEMENTS

The project can be enhanced in the future by adding:

- Backend integration.
- Database support.
- REST APIs.
- Complete CRUD operations.
- Secure authentication.
- Real-time GPS tracking.
- Emergency location sharing.
- Real-time notifications.
- Admin dashboard.
- Mobile application.
- Multilingual support.

13. LEARNING OUTCOMES

Through this project, I gained practical knowledge of:

- HTML
- CSS
- JavaScript
- Web page development
- Form validation
- User interface design
- Project organization
- Testing and debugging
- Git and GitHub
- Technical documentation

14. CONCLUSION

The Smart Tourist Safety Management System provides a centralized web-based platform for tourist safety. It brings multiple safety-related features such as SOS, map, police information, Digital ID, and AI safety into one application.

The project helped in understanding practical web application development, frontend design, JavaScript functionality, validation, testing, and version control using Git and GitHub.

The system can be further extended with a backend, database, REST APIs, and additional safety features to develop it into a complete full-stack application.
